

The Obsessive Compulsive Disorder Institute (OCDI) at McLean Hospital in Belmont, Massachusetts is recruiting a full-time Clinical Research Assistant (RA) to begin late May/early June 2021. The RA will manage several studies about the treatment and assessment of OCD and related disorders which will involve working directly with adult participants in treatment at the OCD Institute (a partial hospital/residential treatment facility). Specific duties will include administering data collection, conducting clinical assessments, overseeing data management, contributing to running the day-to-day operations for research protocols, and IRB management. The RA will work under the direction of Principal Investigators and will also work with a team of postdoctoral fellows and research staff, as well as the clinical staff at the OCD Institute. This is an excellent opportunity to prepare for graduate study in clinical psychology. Mentorship and opportunities to assist in preparing conference submissions and writing scientific articles for publication are possible.

The position will likely begin as a remote position and transition to in-person work. To qualify, interested applicants must have a bachelor's degree in psychology or related field, a minimum of one year of human subject research, an ability to work independently and part of a team, excellent communication, and attention to detail. Previous experience with statistical software (e.g., SPSS or R) and database management is preferred. Contact Martha Falkenstein, PhD, for more information (mfalkenstein@mclean.harvard.edu).
